| 7. Recurring and subscriptions | 8. Ledger                  |
| 9. Reports and exports         | 10. Operations and support |

---

## 1. Initial Access

Open your installation URL, enter username and password, and press **Enter**. Demo credentials after seed data:

```
Username: demo
Password: demo12345
```

**Security:** change credentials in production. Login is temporarily locked by IP after repeated failed attempts.

## 2. Financial Dashboard

The dashboard summarizes assets, liabilities, capital, income, expenses, cash flow, cards, upcoming payments and alerts.

**Review first**  
Cash flow, card debt, exceeded categories and overdue invoices.

**Suggested rhythm**  
Weekly review and month-end close.

## 3. Accounts And Categories

Create main accounts and categories before recording transactions.

| Item       | Use                          | Examples                                 |
|------------|------------------------------|------------------------------------------|
| Accounts   | Where money is held or owed. | Bank, cash, savings, card, loan.         |
| Categories | Transaction classification.  | Payroll, groceries, transport, software. |

## 4. Transactions

Transactions record income, expenses, transfers, card payments and collections. Only **cleared** transactions affect balances and accounting.

| Type         | Impact                                 | Special data                  |
|--------------|----------------------------------------|-------------------------------|
| Income       | Increases a normal account.            | Income category.              |
| Expense      | Decreases a normal account.            | Expense category.             |
| Transfer     | Subtracts origin and adds destination. | Destination account required. |
| Card payment | Reduces payer account and card debt.   | Related card required.        |

## 5. Credit Cards

Cards track limit, debt, available credit, interest, FECl, minimum payment and recommended payment. Create a credit-card account before adding the card.

When statement values are available, enter exact statement balance, minimum payment and cash payment. Moneta prioritizes those values.

## 6. Invoices

Invoices can be issued or received. Moneta calculates total as subtotal plus tax and marks overdue pending invoices automatically.

## 7. Recurring And Subscriptions

Recurring items automate repeated expenses or income. Subscriptions use the same engine but are managed separately for services, insurance and periodic charges.

- Supported frequencies: weekly, biweekly, monthly, quarterly and yearly.
- **Run now** creates due movements and avoids duplicates.

- Transaction type must match category type.

---

## 8. Ledger

The ledger reviews debit/credit entries. Automatic entries are created for cleared transactions and invoices.

### Rule 1

An entry needs at least two lines.

### Rule 2

Total debit must equal total credit.

---

## 9. Reports And Exports

Reports show cash flow, budgets, expense breakdown, invoices and recurring items. CSV exports allow backup and external analysis.

---

## 10. Operations And Support

For production instances:

```
python manage.py migrate
python manage.py createcachetable
python manage.py check --deploy
```

For support, report screen, steps to reproduce, user/edition, error message and screenshot if available.
